

NexaMart Inventory Management & Safety Stock Policy

Version: 2.1 | Effective Date: Q1 2026

Objective

To prevent stockouts, minimize holding costs, and manage lead-time friction across regional distribution centers.

Safety Stock Limits

- Buffer Requirements: All high-velocity SKUs (Category: Grocery & Electronics) must maintain a minimum safety stock buffer equivalent to 14 days of average rolling demand.
- Critical Stockout Thresholds: If available stock drops below 10 units or projected stockout hours exceed 4.0 hours per day, an automated high-priority replenishment flag is raised.

Emergency Reorder Procedures

- Lead-Time Exceptions: For regional lanes where supplier lead time exceeds 7 days, automated purchase orders must be pre-cleared when inventory touches the 21-day reorder point.
- Stockout Mitigation: Rerouting stock from adjacent regional hubs takes precedence over emergency spot-market purchasing.
